

Outline for Trimester Assessment

Contents:

- 1) Focal Camera
- 2) Digital Microscope
- 3) Eye Project
- 4) Self Directed Research (so far)

THEMATIC: A FOCAL CAMERA

For the DIY Photo Camera thematic, I built two cameras: a microscopic and a normal-lens camera. The cameras were built in order to capture a very specific subject: the smartphone screen. For this purpose, the microscopic camera's intention was to capture pixels. The normal lens camera captured the screen at a focus distance of 1 feet, the recommended distance for viewing one's smartphone. The images displayed on the smartphone screen are composite images taken from Google Earth's satellite database.

The process was different for both cameras. The microscopic camera demanded constant reiteration and readjustment. Eventually, the method was simple. Slide a phone under the camera facing the lens, like using an actual microscope. The phone is then turned on in order to expose the film. The normal camera required a shutter to control exposure. Initially, I did not use composite images which resulted in the first trials. The pixels on the microscopic images were not sharp and the images from the normal lens also looked jagged. Compositing satellite images led to a better "zoom" and better screen.

I was interested in this project as an inquiry into the following:

- The act of zooming in and out of a lens by using a microscopic and a normal lens. Adding the elements of a phone displaying satellite imagery created a hyper-narrative. The images are of a DIY camera looking through a micro display (phone screen) at a macro image(the earth via satellite).
- Fluidity of image-language in the use of something captured by a satellite, then rendered into a smartphone photo after extensive compositing, to be captured by a DIY Camera under different conditions of micro and macro image-making. With the DIY camera as a rugged device submitted to manipulation once more, it is controlled to "display" something intentional (pixel and led screen). This suggests the mutability of the device(camera) and the image(micro,macro,composite, appropriated).

Initial trial images without composited images, strict exposure time and stabilization

microscopic images

normal-lens images

Sample of satellite image used vs Composite

Finals Microscopic Images vs Close-Up Zoom of Pixels

Digital Microscope

Research

I used a digital microscope, used for repairing digital devices, in the same process. I captured satellite images without having much control, submitting to the built-in software-hardware components of the digital microscope. The resulting images show pixels and image in a more unitary form. The medium and the subject lose their elusiveness in this process. I decided to conclude the iterations of the DIY Thematic with using a pre-built microscoping camera as a testament to the initial inquiry on the general fluidity of images under varying gazes(micro,macro,DIY and, now, digital).

Eye ResearchLabs

function(chaos)//a planet is not a sphere

For the Eye Project, I was interested in building a synthetic world as a moving image. Drawing from the Barnsley fern formula, I was able to “mess about” and generate images that seemed to morph into certain familiar structures: a mountain, trees, a planet/sphere. These structures emulate a certain indigenous world (“of nature, non-modern, earthy”). My main frame of reference are two creation myths of my parent’s indigenous tribes (Khasi and Jaintia) where the world began as a massive tree falling into an ocean and a half-boiled egg, respectively. Both myths engage with the volatility of the world and are also prescriptive about its transience. Hence, the title “a planet is not a sphere.”

I worked with the Barnsley fern fractal formula to generate 3D moving-images. The 3D fractals were then layered with composited textures. Then I tried to emulate a familiar methodology, zooming-in and zooming-out, during editing. For the sound, I worked with Fiete Stoll (a Berlin-based sound engineer), to compose binaural meditation sounds from recorded ambient wind.

My initial plan for the Eye project was to record a film back in my homeland Meghalaya. However, owing to political riots and curfews, I chose not to go. Dissociating as far away as I could from this “reality” of home, I decided to built a different world from these “myths,” opening the 3D synthetic world to natural imagery.

16 mm

For this thematic, I collaborated with Thy and Lea. We were limited by both the length of the film as well as the bitter cold of Rotterdam. Nevertheless, we persisted and captured the streets of Rotterdam in as much random footage as we could. The feeling of finally editing and watching our movie, however, felt quite rewarding.

self directed research

I am primarily interested in making work that's auto-archival. Specifically work that includes my labor practices, identity, memory, externality and physicality. The medium for this practice is something I am currently researching. I have worked on video game footage as a reference point for my labor practice as a ghostwriter. I have configured satellite composite moving-images of places I've been brought up in, having never lived in a single location for more than 5 years. I engage with the internet as an external device of memory recording (link here). I also engage in photographing walks I make from home to specific places. Perhaps to an extent I see my current Masters study as a time of "auto-archiving" and reiterating mediums I am familiar with.

I am interested in many queries that arise from this auto-archival mechanism. These include:
The Silent Subject Archive: Are we all individuals silently auto archiving on the internet?
Archiving as a verb in the present tense. How to depict/play with this visually?
Representation in an institutional archive. Is representation a series of sensorial memory?

Currently, I see this as a point of inquiry and less as a subject of my practice-based research. I hope, with due time and (current) isolation, I figure out something more concrete. Hoping for it to be a screenplay.

The rise of the cash-rich firm in the 21st Century
- Anton Cebalo, Historian

∴ the global increase in corporate savings follows the structural, economic changes which began during the neoliberal turn of the 1980s. Commonly termed the 'corporate savings glut,' this new tendency in capital accumulation emerged during a decline in global labor shares, the expansion of tax havens, and new modes of corporate management. The rise of corporate cash reserves should be linked to labor's diminishing economic relevance and may point to a new paradigm of capitalist growth.

the text of the Bill, however, not only undermines that objective, but also erases the plural fabric of the Indian nation. In its careful listing of protected communities, it explicitly and intentionally — leaves out Muslims.

Also, there is no explanation for why the CAB has picked out Pakistan, India, and other countries surrounding India.
